

# The SM as an EFT

### SM EFT

SM is not the ultimate theory of nature, so it must be viewed as an EFT. We should add higher-dim operators to its Lagrangian:

$$\mathcal{L}_{SM} = \mathcal{L}_{SM}^{(4)} + \frac{1}{\Lambda} \sum_{k} C_{k}^{(5)} Q_{k}^{(5)} + \frac{1}{\Lambda^{2}} \sum_{k} C_{k}^{(6)} Q_{k}^{(6)} + \mathcal{O}\left(\frac{1}{\Lambda^{3}}\right),$$

- We don't know the value of Λ (and different new physics could arise at different Λ's),
- Naturalness  $C_k \sim 1$
- Model independent way to search for New Physics

## Operator basis

Conceptually, writing down the operators is not more difficult than what we did for pure QED and QCD, but in practice, things become much more involved

- 3 gauge groups:  $SU_c(3) \times SU_L(2) \times U_Y(1)$
- Complicated matter sector

	fermions					scalars
field	$l_{Lp}^j$	$e_{Rp}$	$q_{Lp}^{lpha j}$	$u^{lpha}_{Rp}$	$d^{lpha}_{Rp}$	$arphi^j$
hypercharge $Y$	$-\frac{1}{2}$	-1	$\frac{1}{6}$	$\frac{2}{3}$	$-\frac{1}{3}$	$\frac{1}{2}$

### d = 5 operator

Only a single operator arises at d = 5

- Violates lepton number
- After EW symmetry breaking, this term gives
   Majorana masses to v's and causes v-mixing.
- A is very large ~10<sup>14</sup> TeV, not relevant for LHC.

## d = 6 operators

Buchmüller and Wyler, Nucl.Phys. B268 (1986) 621 Grzadkowski, Iskrzyński, Misiak, Rosiek JHEP 1010 (2010) 085

Many operators at d=6! Construction of operator basis is nontrivial, use

- Fierz identities (Dirac and Color), ...
- integration by part, classical EOM, ...

to reduce operators to a minimal set

- 59 operators (compared to 14 at d=4) which conserve baryon number B
- + 5 additional ones if *B* is violated
- flavor indices: 2499 parameters with B conserved

Flavor indices: 3<sup>4</sup>= 81... Many couplings!

## EFT for Higgs physics

Not all of the 59 operators are important for Higgs physics, but a significant number of them is.

- A lot of recent work to identify the most important NP effects in Higgs physics and to parameterize possible effects in a model independent way.
- Deviations are often parameterized as deviations from SM coupling strengths to given particle type.

#### Value of $\Lambda$

We have a plethora of SM measurements which impose constraints on  $\Lambda$ 

- Neutrino masses  $\Lambda \sim 10^{14} \, \text{TeV}$
- Flavor physics  $\Lambda \gtrsim 1 100 \text{ TeV}$ 
  - Most stringent bounds: FCNC's
- EW precision physics  $\Lambda \gtrsim 2 \text{ TeV}$

Absence of New Physics signals can indicate either a high scale, or a special form which suppresses (e.g. flavor physics) signals.

#### Naturalness Problem

The SM contains a single relevant operator

$$\mu^2 \, \varphi^\dagger \varphi = C^{(2)} \, \Lambda^2 \varphi^\dagger \varphi$$

with  $2\mu^2 = m_H^2$ . Naturalness:

- Expect New Physics around  $m_H$ .
- Should protect the Higgs mass from contributions from higher scales (such as  $M_{\rm pl}$ ).
  - SUSY, compositeness, ... ?

Naturalness problem: where is everybody?
